Goldman Sachs — Risk, AI Model Validation, Vice President

Dear Hiring Team,

I am writing regarding the AI Model Validation Vice President role in Risk.

Fifteen years in bank audit and risk at JPMorgan Chase and Citigroup, preceded by examinations work with the OCC and a state regulator, means I have spent most of my career on the question this role exists to answer: is this model sound enough to be relied on, and can that be demonstrated to someone who does not take it on faith. At JPMorgan Chase I owned Basel III risk-weighted asset and CCAR reporting across the derivatives, loan, and securities portfolios, and identified \$180 million in capital optimization — model output under supervisory scrutiny, with the reporting chain through FR Y-14Q, FFIEC 101, and Pillar 3 attached to it. I understand SR 11-7 as an operating constraint rather than a citation.

The AI-specific part is not theoretical for me. I designed and deployed a retrieval-augmented review assistant inside Citi's audit function that cut review cycle time by roughly 35%, and proposed an AI governance framework referencing the NIST AI Risk Management Framework and SR 11-7. Building one taught me where the validation surface for these systems actually is — the retrieval layer, the evaluation set, the prompt and version control, the failure modes that do not show up in an accuracy metric — and how little of that a conventional validation template reaches.

What I would add to the team is a specific view on the risk that survives validation. My doctoral work at Florida International University, qualifying examination passed in July 2026, studies automation bias in professional judgment. A model that has been validated and is performing to specification can still degrade the decision it feeds, because a confident output arriving early in a reviewer's process becomes the anchor for their conclusion. That is a control design problem sitting just outside the model boundary, and for AI models with human decision-makers downstream it is where I think validation coverage is thinnest.

I would welcome a conversation.

Sincerely, Yasir A. Malik _____ · _____
