JPMorganChase — AI/ML Governance & Automation Lead, Vice President

Dear Hiring Team,

I am applying for the AI/ML Governance and Automation Lead role. I have spent fifteen years in bank audit and risk, and the last several building AI into an audit function rather than commentating on it — which is, I think, the combination this role is actually asking for.

At Citigroup I designed and deployed a retrieval-augmented review assistant into the internal audit workflow, reducing review cycle time by roughly 35%, and proposed an AI governance framework for the firm's governance team grounded in the NIST AI Risk Management Framework and SR 11-7. Before that, at JPMorgan Chase, I owned Basel III RWA and capital adequacy reporting and led the Resolution and Recovery Planning program, coordinating more than fifty stakeholders across Federal Reserve and FDIC submissions. Earlier still, I examined banks — first with the OCC, then a state regulator — which means I have argued a control's adequacy from the supervisor's side of the table as well as the firm's.

The reason I care about model and AI governance specifically is that I research it. My doctoral work at Florida International University, where I passed the qualifying examination in July 2026, examines automation bias in professional judgment: what happens to a reviewer's conclusions when the system's output arrives before their own. The failure mode I find most underestimated is not a model producing a wrong answer — it is a model producing a confident one early enough to become the anchor, and a reviewer whose independent judgment quietly collapses onto it. Governance frameworks catch model performance well. They are much weaker at catching that.

I would welcome the chance to discuss how the team is approaching oversight design as automation scales.

Sincerely, Yasir A. Malik _____ · _____
