

The Field Never Integrated

Run the maps with management split into its sub-fields and two things break — then a third integration point appears.

(A) The circle is too coarse

One circle per discipline hides the real picture: strategy sits deep inside IB, HR partly, OB barely touches it.

(B) The crossbars run both ways

THE THIRD INTEGRATION POINT

Management gave IB the integral plan for operations. Nobody has written the integral plan for evidence.

Both maps describe integration as TOPICAL — disciplines meet where their subject matter overlaps, which is rare and accidental. There is a second kind. Every sub-field above becomes international at the same moment: when it must collect comparable evidence from specialists in more than one country. That is structural, and field-wide by construction.

6

eligible per 100,000
measured, before fielding

Six disciplines, thirteen shared boundaries — and two that do not exist

The relationships are consistent and the gaps are the finding. Drawn as a network rather than as overlapping circles, because six circles cannot hold these thirteen adjacencies without inventing regions that are not claimed.

Every pairing, read off

	MKT	FIN	IB	GM	CSR	SCM
MKT

GM						—
CSR						—
SCM				—	—	

Marketing, Finance and International Business each touch all five others. General Management and CSR touch everything except Supply Chain. Supply Chain touches only those three central disciplines — the two blank cells are the whole structure of the map.

WHAT THE MAP STILL DOES NOT SAY

It shows WHO touches WHOM, not what happens at the touch point. Name the intersections — international marketing, cross-border capital, global sourcing — and the same structural question returns: each one becomes international only when evidence must be gathered comparably in more than one country.

Questions I expect

and the answers I am prepared to defend

Q Isn't a shared difficulty just a shared tool? Physics and biology both need microscopes.

A It is not a tool, it is a definition. What makes a study international is comparison across countries — and comparison requires comparable populations. The constraint sits at the definition of the field, not at its equipment.

Q Where is the evidence?

A Screening a commercial research panel of 334,976 members against one specialist professional criterion returned roughly twenty eligible people — near six per hundred thousand. Visible on the platform's own configuration screen before any money was committed.

Q How would you test it?

A Replicate the prevalence check across countries for the same specialist role, and report the distribution. If reachability varies sharply by country, comparative designs in every one of these sub-fields rest on an assumption nobody states.

Q Doesn't strategy already cover this?

A Strategy is topical integration — the disciplines meet because their subject matter overlaps. This is structural: it binds every sub-field the moment it goes cross-national, whether or not the topics have anything in common.

Q Which discipline does this belong to?

A None of them, and that is the argument. It is a constraint on the act of comparing, so it sits between the circles rather than inside one.

Q Are you claiming the existing maps are wrong?

A No. They are right about topical integration and honest that neither map resolves every classification difficulty. I am proposing a second axis they do not draw — not replacing theirs.
