Re: Risk and Audit Governance Program Manager

Dear Hiring Team,

Your posting asks for someone who can build a vendor risk and audit program from scratch, use AI to automate the auditing, and still catch what the automation gets wrong. I have done that combination in one job, and I would like to do it for Global Vendor Operations.

I build the framework first. At Citi Internal Audit I designed the risk assessment and audit framework for enterprise AI and third-party AI: use-case intake, risk tiering by criticality, a control library mapped to NIST AI RMF, governance policies, audit playbooks and post-deployment monitoring KPIs. It was built so that a new auditor could pick up a playbook and apply it the same way the tenth time as the first, which is what "consistent adherence" means in practice across many external partners.

Then I automate the checking, and I do not trust the automation. I specified, built and put into production a retrieval-augmented review assistant in Python and LangChain that checks work against standards. It cut the review cycle by roughly **35%**. The part that matters for your role is the discipline around it: every output reviewed, edge cases resolved by hand, quality control held to the same bar as manual work, so the tool was itself auditable. My doctoral research at FIU is on exactly this failure mode: how reviewers stop validating AI output once it looks confident.

When something fails, I run the root cause and close it properly. I led consent-order remediation across **15+ business units**: root cause analysis of control failures, corrective action plans with owners and dates, and validation of each remediation to closure, with evidence accepted by quality assurance and external regulators. I briefed executives and the Board Audit Committee on the findings and the key risk indicators behind them, translating technical control failures into business risk a non-technical leader could act on. At JPMorgan Chase I ran Resolution & Recovery Planning, the firm's continuity submission to the Federal Reserve and FDIC, across **50+ stakeholders** in five functions, none reporting to me.

I read controls the way an examiner does, because I was one, at the Florida Office of Financial Regulation, before I spent my career on the other side of the table. For a vendor operation, that means asking not whether the agreement says the control exists, but whether anyone can show me that it operated.

This is an executive individual-contributor role building a program from nothing, and that is the work I do best. I would welcome a conversation about what Global Vendor Operations needs in its first year.

Sincerely,

Yasir A. Malik
