BNY — Director, Model Risk Management AI, Wealth and Investment

Dear Hiring Team,

I am writing regarding the Director, Model Risk Management AI role in Wealth and Investment.

My background sits at the three-way intersection this role occupies. I began as a bank examiner with the OCC and a state regulator, spent fifteen years in audit and risk at JPMorgan Chase and Citigroup, and most recently built AI into an audit function directly — designing and deploying a retrieval-augmented review assistant at Citi that cut review cycle time by roughly 35%, and proposing an AI governance framework grounded in the NIST AI Risk Management Framework and SR 11-7. At JPMorgan Chase I owned Basel III RWA and capital adequacy reporting and identified \$180 million in capital optimization, so model output under supervisory scrutiny is familiar ground rather than a new context.

What I would bring beyond the standard validation toolkit is a research perspective on the part of AI model risk that validation does not reach. My doctoral work at Florida International University — qualifying examination passed in July 2026 — examines automation bias in professional judgment. A validated model that produces a confident output early in a reviewer's process becomes the anchor for that reviewer's conclusion, and the resulting judgment can be materially worse even when the model is performing exactly to specification. That is a control design problem, not a model performance problem, and it is where I think AI model risk in wealth and investment is most exposed.

I would welcome a conversation about how the team is thinking about oversight design.

Sincerely, Yasir A. Malik _____ · _____
