**Verisk — Director, AI Governance Lead**

Dear Hiring Team,

I am writing regarding the Director, AI Governance Lead role in Jersey City.

Verisk's business is selling analytic judgment to customers who then rely on it. That makes AI governance a product question as much as a compliance one — the models have to be explainable to an underwriter, an actuary, a regulator, and a customer who is being told what their risk is. I have spent fifteen years on the side of that problem where someone has to prove the analytics hold up: first as a bank examiner with the OCC and a state regulator, then in audit and risk at JPMorgan Chase and Citigroup.

The concrete part of that experience is documentation and defensibility under outside scrutiny. At JPMorgan Chase I owned Basel III risk-weighted asset and capital adequacy reporting, and led Resolution and Recovery Planning across more than fifty stakeholders for Federal Reserve and FDIC submissions — work where the number itself matters less than whether you can show how it was produced and who signed off. At Citigroup I ran thematic audits across more than fifteen business units and structured the reporting that went to the Board Audit Committee. That is the same mechanic an AI governance function needs: a model inventory somebody actually maintains, a lifecycle with real gates, and evidence trails that hold when an external party pulls on them.

I have also built the technology, not just reviewed it. I designed and deployed a retrieval-augmented AI review assistant inside Citi's audit function that cut review cycle time by roughly 35%, and proposed the AI governance framework that would sit around tools like it, referencing the NIST AI Risk Management Framework. I know what these systems fail at from having shipped one.

My doctoral research at Florida International University — qualifying examination passed in July 2026 — looks at automation bias in professional judgment: what happens to an expert's conclusion when a confident machine output arrives early in their process. For a company whose customers are professionals making decisions on top of Verisk analytics, I think that is the governance exposure that is easiest to miss, because it shows up even when the model is performing exactly as designed.

I would welcome a conversation about how the function is being built.

Sincerely, Yasir A. Malik \_\_\_\_\_ · \_\_\_\_\_
