Hiring Team — Regulatory Audits, Global Affairs

Google

New York, NY

Re: Program Manager III, Regulatory Audits, Global Affairs

Dear Hiring Team,

I am applying for the Program Manager III, Regulatory Audits, Global Affairs role. The mandate the posting describes — coordinating a portfolio of regulatory programs, designing compliance programs cross-functionally with product and legal, and leading audits conducted by third-party auditors and regulators — is the work I have been doing inside Citi Internal Audit for the past five years.

The exact mandate, demonstrated. At Citi I built and ran Internal Audit's AI/GenAI regulatory program from scratch: use-case intake, model risk tiering, control library, and post-deployment monitoring, mapped to NIST AI RMF, SR 11-7, ISO/IEC 42001, the EU AI Act, and the Colorado AI Act — the new-and-emerging-regulations lane the posting names. I coordinated regulatory audit execution across 15+ business units under OCC and Federal Reserve oversight, led consent-order audit execution and sustainable-closure validation accepted by examiners, and drove the policies, processes, and training that scaled the program. The Citi *Delivers with Pride* award recognized the work.

The technical-audit angle, not theoretical. I also shipped the program's tooling: a RAG-based Workpaper Quality Assistant with prompt-injection guardrails, SHAP/LIME explainability, and human-in-the-loop controls, which cut audit cycle time ~35% and is itself auditable. So I have built an AI system *and* designed the controls a regulator would audit against it — the two sides of a technical regulatory audit, in one project.

An honest framing of the lateral. My regulatory pedigree is financial-services (OCC, Federal Reserve, FDIC, PCAOB) rather than infosec / application-security testing. What transfers cleanly is the operating model: portfolio-coordinated third-party audits, cross-functional program design with Legal and product, examiner engagement at scale, and the discipline of producing audit-ready evidence under regulator scrutiny. The infosec-control vocabulary (ISO/IEC 27001, application security testing, code review) is the part I would ramp on — the program-management instinct that makes a regulatory audit go well is already there.

What I bring that the credentials list won't surface: a Bank Examiner's instinct for how a regulator will read a finding, a practitioner's working knowledge of LangChain, RAG, and the Anthropic Claude API, and a DBA candidate's framing for problems Google is already living. The one-page resume attached aligns the experience against your minimum and preferred qualifications. I'd welcome the conversation.

Sincerely,

Yasir A. Malik
