Internal Audit — Embed Data Analytics

Goldman Sachs

200 West Street, New York, NY 10282

Re: Internal Audit — Data Analytics — New York — Vice President

Dear Hiring Team,

The posting says the Embed Data Analytics team "works closely with auditors to understand their pain points and develop data-centric solutions to address the same." I have been on both ends of that sentence. At Citi Internal Audit I was the Vice President with the pain point — and I built the solution: a production retrieval-augmented **Workpaper Quality Assistant** in Python and LangChain, with vector search over unstructured workpapers, SHAP/LIME explainability, prompt-injection guardrails, and Alteryx integration. It cut audit review cycle time **~35%** and created continuous coverage where sampling had been the only option. I gathered the requirements, wrote the code, and put it in production.

Data engineering and governance, under examination. Earlier at Citi I consolidated **500+ legal-entity data sources** into governed master data — data modeling, ETL, ownership and lineage, and the data-quality controls that made the output certifiable. It fed automated **FR 2900** and **TIC** regulatory filings at **99.8% accuracy**. That is the "data blessing" problem the posting names, solved where the consequence of blessing bad data was a regulatory filing. At JPMorgan I automated capital and liquidity reconciliations, cutting manual review **~40%** and eliminating a recurring source of reporting error — repeatable-process automation applied to capital data.

The statistics are formal, not improvised. My MBA is in **Financial Mathematics**. My doctoral qualifying research at FIU (IRB-25-0462, completed July 2026) was a designed experiment, analysed in **SPSS**, of how expert judgment shifts under a persistent reference point — the same mechanism an automated recommendation creates. Earlier, I built credit-risk MIS over a **\$500M+** retail portfolio in SAS and SQL. The dissertation in development measures automation bias in AI-assisted judgment, which is directly the question a firm faces when analytics starts steering audit testing.

What I would bring that a data scientist alone would not. Most analysts joining this team have to learn what an auditor actually needs from a dataset: which population is complete enough to test, which control gap the sample is meant to expose, what evidence survives quality assurance and an external regulator. I spent five years answering those questions across **15+ business units**, including consent-order issue closure with evidence accepted by external regulators. I would arrive able to specify the analytic, not only to build it.

The honest gaps. My bachelor's is in Banking and Finance, not Computer Science — the quantitative training came through the Financial Mathematics MBA and doctoral research rather than a CS degree. On the preferred list I have SAS and SPSS but not R, and Tableau and Power BI rather than Spotfire or QlikView; those are tool-syntax, not method. My machine learning is applied rather than research-grade: scikit-learn, regression and classification, clustering, and explainability in service of shipped tools. I would rather state that plainly than have it surface in a technical screen.

I am in Newark; 200 West Street is a direct commute. I would welcome the conversation.

Sincerely,

Yasir A. Malik
